ABSTRACT:

Music streaming applications have become an essential part of modern digital entertainment, allowing users to access and enjoy music conveniently from anywhere. EchoBlue is a web-based music streaming and playlist management application developed using the Angular framework and TypeScript, designed to provide a smooth and interactive platform for exploring and playing music.

The project focuses on building a responsive and scalable frontend that allows users to browse songs, explore artists, create playlists, and play audio tracks through a simple and intuitive user interface. The application emphasizes user engagement by providing easy navigation between songs, artists, and playlists while maintaining a clean and modern design.

Angular's component-based architecture is used to organize the application into reusable modules such as song lists, artist views, playlist management, and a music player. This approach improves code maintainability, scalability, and overall application performance.

The application supports core features such as music playback controls, playlist creation and management, artist exploration, and real-time playback tracking. Angular services and RxJS observables are used to manage data flow and audio playback efficiently across components.

EchoBlue serves as a foundation for a full-featured music streaming platform and can be extended with advanced features such as user authentication, personalized recommendations, advanced search, backend integration, and cloud-based music storage. This project demonstrates the practical implementation of modern web technologies in building interactive multimedia web applications.

OBJECTIVES:

- To design and develop a web-based music streaming and playlist management application using the Angular framework and TypeScript.
- To provide users with a simple, interactive, and user-friendly interface for browsing songs, exploring artists, and managing playlists.
- To implement core music playback features such as play, pause, track navigation, and volume control.
- To apply Angular's component-based architecture for better code organization, modularity, and maintainability.

- To implement Angular routing for smooth navigation between different sections such as songs, artists, playlists, and the music player.
- To ensure a responsive user interface that works smoothly across different devices and screen sizes using Angular Material.
- To create a scalable frontend structure that can be extended with advanced features such as user authentication, music recommendations, and backend integration.
- To demonstrate the practical use of modern web technologies like Angular, TypeScript, and RxJS in building real-world multimedia applications.

SCOPE OF THE PROJECT:

- To develop a web-based music streaming and playlist management application using Angular and TypeScript.
- To provide basic music playback features such as play, pause, track navigation, and volume control.
- To allow users to browse songs, explore artists, and view available music collections within the application.
- To design a responsive and user-friendly interface using Angular Material for better usability across devices.
- To follow a modular and component-based architecture for easy maintenance, scalability, and code reuse.
- To support playlist management features such as creating playlists and adding songs to playlists.
- To allow future enhancements such as advanced search, user authentication, personalized recommendations, and backend database integration.

TOOLS & TECHNOLOGIES USED:

Tools/Technologies	Purpose
Angular (v20)	Frontend framework
TypeScript	Application logic
Angular Material	UI components and styling
JSON Server	Mock backend
RxJS	Asynchronous data handling
HTML5	Page structure
CSS3	Styling and layout
Node.js	Runtime environment
Angular CLI	Project creation and management
VS Code	Code editor
Chrome DevTools	Testing and debugging

APPLICATION STRUCTURE OVERVIEW:

- The EchoBlue application is developed using Angular with a component-based architecture.
- The src folder contains all the core application files including components, services, models, and routing configurations.
- Components are responsible for handling the user interface and displaying features such as song lists, artist details, playlists, and the music player.
- Services manage data handling, music playback logic, and communication between different components.
- Routing is implemented using Angular Router to enable smooth navigation between different sections like songs, artists, playlists, and now playing.
- Modules are used to organize different features of the application and maintain a clean project structure.
- This structured architecture improves scalability, maintainability, and makes it easier to add new features in the future.

MODULE DESCRIPTION:

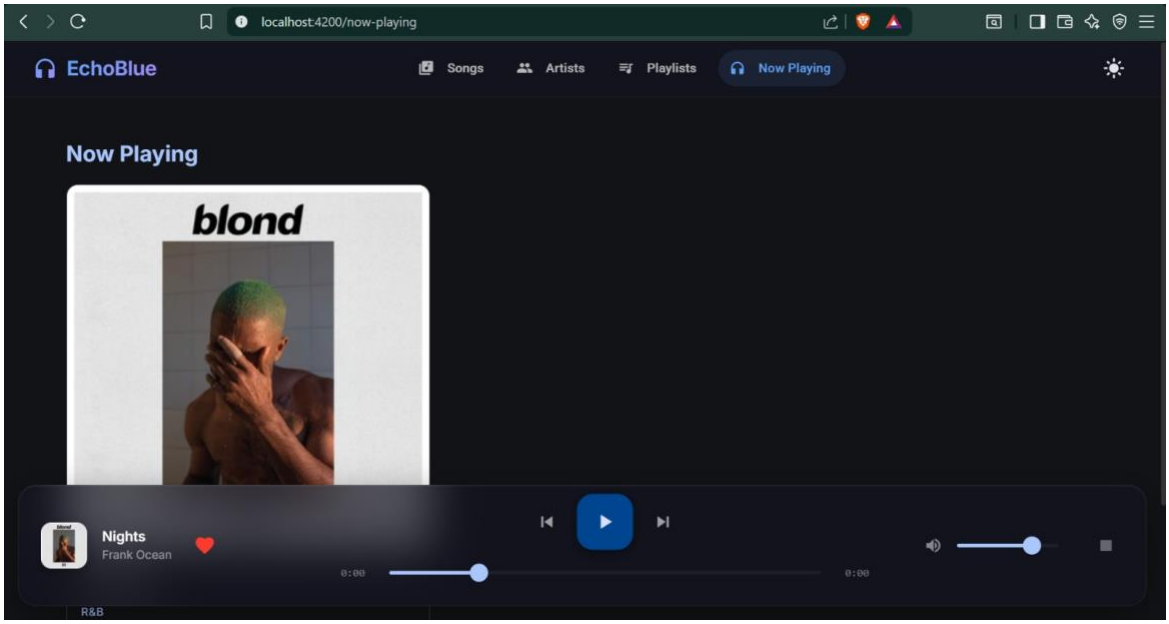
1)Dashboard Description

The Dashboard Module acts as the main landing page of the EchoBlue music streaming application. It provides users with an overview of the application's content and allows quick access to important sections such as songs, artists, and playlists.
This module is designed to improve user engagement by displaying featured songs and providing smooth navigation to other parts of the application. It serves as the starting point where users can explore music and interact with the platform.

KEY FUNCTIONS:

- Displays featured and popular songs available in the application
- Provides quick access to artists and playlists
- Enables smooth navigation to different modules such as songs, artists, and playlists
- Acts as the entry point of the EchoBlue application

SCREENSHOT:



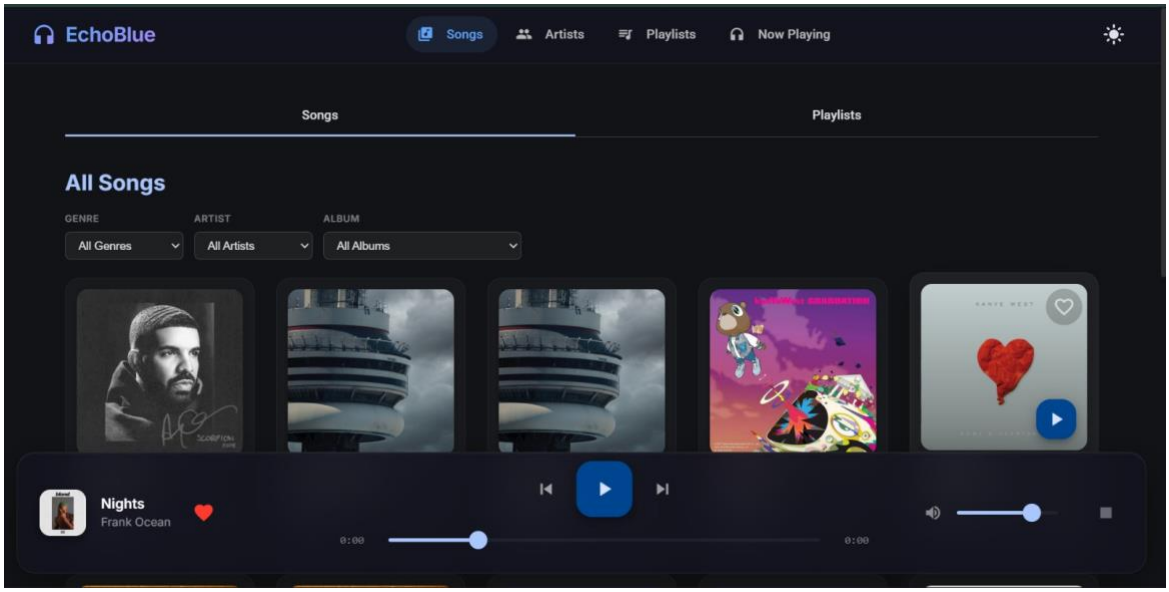
2) Song List Module

The Song List Module is responsible for displaying all the songs available in the EchoBlue music streaming application. This module allows users to browse through different songs and interact with them easily. It provides an organized list of songs along with basic information such as the song title, artist name, and album.
Users can play songs directly from the list and add their favorite tracks to playlists. The module works closely with the music player component to manage playback and ensure a smooth listening experience.

KEY FUNCTIONS:

- Displays the complete list of available songs in the application
- Shows song details such as title, artist, and album
- Allows users to play songs directly from the list
- Allows users to add songs to playlists
- Enables easy browsing and selection of songs

SCREENSHOT:



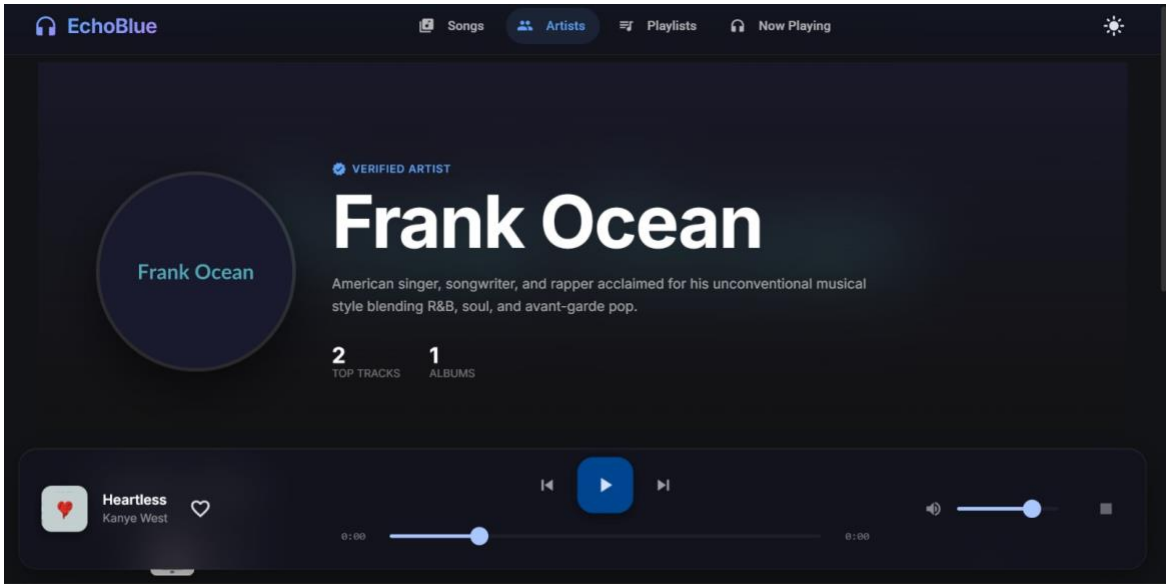
3)Artist Module

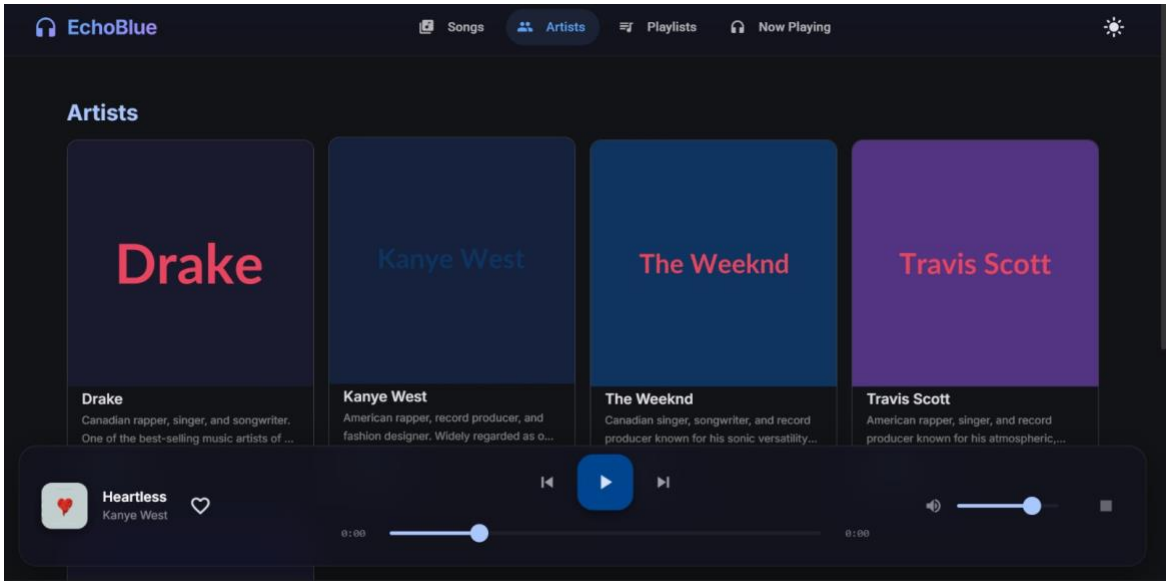
The Artist Module is responsible for displaying information about different artists available in the EchoBlue music streaming application. This module allows users to explore various artists and learn more about their music.
It provides details about each artist such as their name, genre, and the songs associated with them. Users can select an artist to view their profile and browse the songs created by that artist. This module helps users discover music based on their favorite artists.

KEY FUNCTIONS:

- Displays a list of artists available in the application
- Shows artist information such as name and genre
- Allows users to view songs by a selected artist
- Helps users discover music through artist profiles

SCREENSHOT:





4) Playlist Module

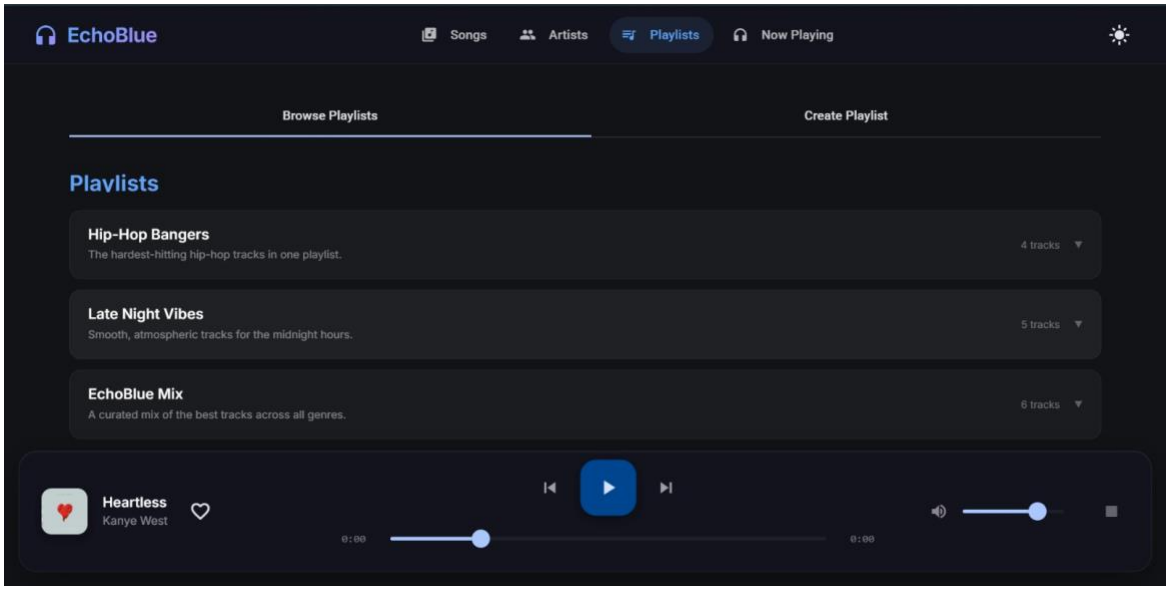
The Playlist Module allows users to organize and manage their music by creating and maintaining playlists in the EchoBlue music streaming application. This module helps users group their favorite songs into collections based on their preferences, mood, or genre.

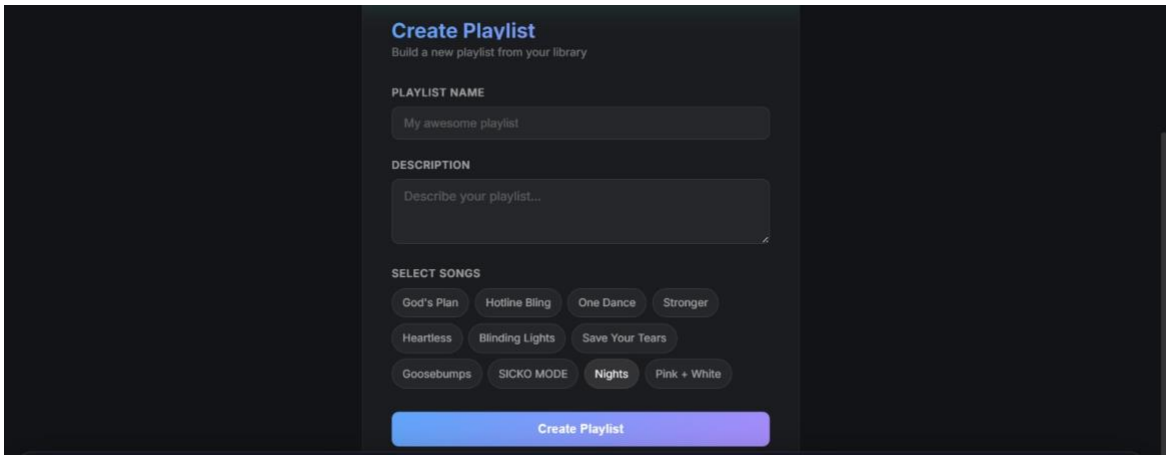
Users can create new playlists, add songs to existing playlists, and manage their playlist content easily. The module improves the overall listening experience by allowing users to play multiple songs in sequence from a selected playlist.

KEY FUNCTIONS:

- Displays available playlists in the application
- Allows users to create new playlists
- Enables users to add songs to playlists
- Allows users to remove songs or delete playlists
- Shows the number of tracks in each playlist

SCREENSHOT:





5) Music Player Module

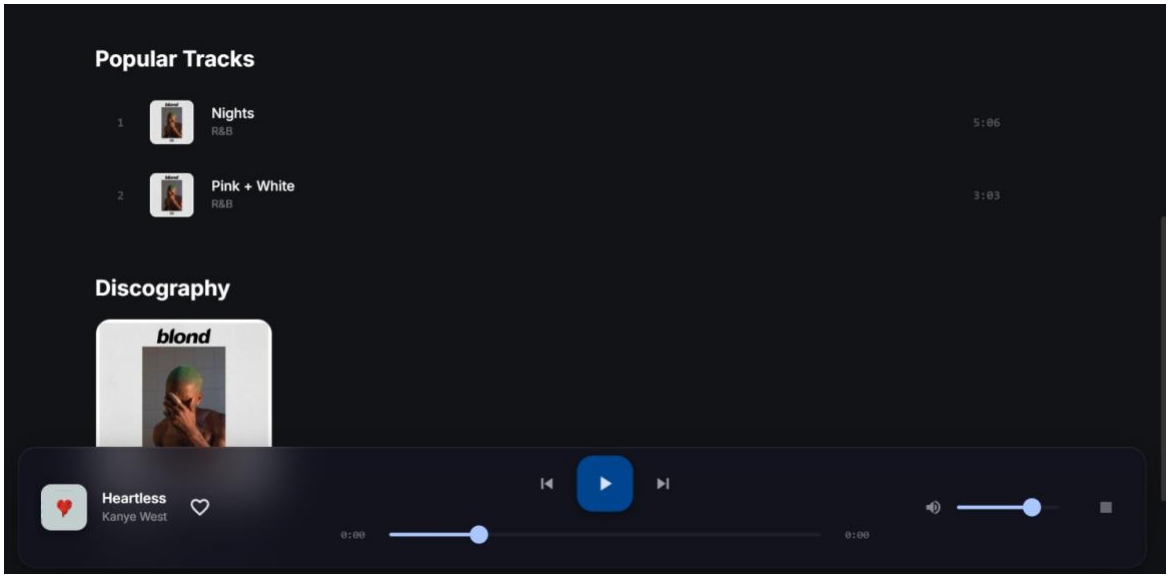
The Music Player Module is the core functionality of the EchoBlue music streaming application. This module is responsible for handling the audio playback of songs and displaying information about the currently playing track.

It provides users with controls to manage music playback such as playing, pausing, and navigating between tracks. The module also displays the progress of the currently playing song and allows users to adjust the volume for a better listening experience.

KEY FUNCTIONS:

- Displays details of the currently playing song
- Provides play and pause controls
- Allows track navigation between songs
- Displays song progress using a progress bar
- Allows users to adjust volume levels

SCREENSHOT:



UI & STYLING STRATEGY:

The EchoBlue application follows a modern and visually appealing user interface designed to provide a smooth and enjoyable music streaming experience. The UI focuses on simplicity, clarity, and easy navigation so that users can browse songs, explore artists, and manage playlists without difficulty.

Angular Material components are used to maintain consistency in design elements such as buttons, cards, toolbars, and navigation menus. A card-based layout is used to display songs, playlists, and artists in a well-structured and organized manner. This layout improves readability and makes it easier for users to interact with the application.

CSS3 is used extensively for styling, including layout structure, spacing, typography, and hover effects. Flexbox and grid layouts are implemented to create a responsive design that adapts smoothly across different screen sizes such as desktops, tablets, and mobile devices.

The application also supports dark and light themes, which enhance the visual appearance and provide a comfortable viewing experience for users. Smooth animations and transitions are applied to improve user interaction while maintaining performance.

Overall, the styling strategy ensures a clean, responsive, and professional interface while maintaining performance, accessibility, and flexibility for future UI improvements.

ANGULAR & TYPESCRIPT OVERVIEW:

Angular is a modern, open-source frontend framework used to build dynamic and scalable web applications. In the EchoBlue project, Angular is used to structure the application using a component-based architecture, where each feature such as the dashboard, songs, artists, playlists, and music player is developed as a separate component or module. Angular provides powerful features like data binding, dependency injection, and routing, which help in building an efficient, maintainable, and interactive application.

TypeScript is a strongly typed superset of JavaScript and is used as the primary programming language in Angular applications. In this project, TypeScript is used to implement application logic, manage components and services, and define data models such as songs, artists, and playlists. It improves code quality by providing type safety, better error detection, and improved readability. TypeScript also helps make the application more scalable, structured, and easier to debug and maintain.

Together, Angular and TypeScript enable the development of a structured, reliable, and high-performance music streaming and playlist management web application like EchoBlue.

KEY FEATURES:

FEATURE	DESCRIPTION
User-Friendly Interface	Provides a clean and intuitive UI for easy navigation
Music Playback	Allows users to play, pause, and control audio tracks
Playlists	Enables users to create and manage playlists
Artists Section	Shows artists along with genre information
Featured Tracks	Highlights popular and trending songs
Now Playing	Displays currently playing song details
Responsive Design	Works smoothly on different screen sizes
Material UI	Ensures modern, consistent, and attractive design

CHALLENGES FACED & SOLUTIONS:

CHALLENGES	SOLUTION
Component communication	Used Angular services for data sharing
Asynchronous data handling	Implemented RxJS Observables
UI consistency	Adopted Angular Material components
Routing between pages	Implemented Angular Routing Module
State management for playback	Managed state using shared Audio services
Responsive layout	Used CSS Flexbox and Grid

OUTCOME:

- Successfully developed a web-based music streaming and playlist management application using Angular and TypeScript.
- Implemented a clean and responsive user interface using Angular Material and CSS3 for an improved user experience.
- Enabled core functionalities such as music playback, playlist management, artist browsing, and now playing view.
- Achieved smooth navigation between different modules using Angular Router.
- Ensured efficient data handling and real-time updates using Angular services and RxJS Observables.
- Built a scalable, modular, and maintainable application architecture that supports future enhancements and feature expansion.

FUTURE ENHANCEMENTS:

- Implement user authentication and profile management to allow users to create and manage personal accounts.
- Add playlist creation and customization features so users can organize songs based on their preferences.
- Integrate a real backend and database to store music files, playlists, and user data securely.
- Introduce search and filtering options for songs, artists, and playlists to improve music discovery.
- Add a music recommendation system that suggests songs based on user listening history and preferences.
- Enable offline music playback and download support so users can listen to music without an internet connection.

CONCLUSION:

The EchoBlue project successfully demonstrates the development of a modern web-based music streaming and playlist management application using Angular and TypeScript. The application provides a clean, responsive, and user-friendly interface that allows users to browse songs, explore artists, manage playlists, and play music seamlessly.

Through a modular and component-based architecture, the project ensures scalability, maintainability, and efficient data handling. The use of Angular services, routing, and RxJS observables enables smooth navigation, real-time updates, and asynchronous operations within the application.
Overall, this project highlights the practical implementation of modern web technologies in building interactive multimedia web applications. It also serves as a strong foundation for developing a full-featured music streaming platform with advanced features in the future.
